## CYCLIC GUANOSINE 3',5'-MONOPHOSPHATE PHOSPHODIESTERASE INHIBITORS

**Field of the Invention**

This invention relates to pharmaceutically useful compounds which inhibit cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDEs). More notably, the compounds of the invention are potent inhibitors of type 5 cyclic guanosine 3',5'-monophosphate phosphodiesterase (cGMP PDE5) and are selective over other phosphodiesterases, including PDE6. The compounds of the invention therefore have utility in a variety of therapeutic areas.

The compounds of the invention are of value for the curative or prophylactic treatment of mammalian sexual disorders. In particular, the compounds are of value in the treatment of mammalian sexual dysfunctions such as male erectile dysfunction (MED), impotence, female sexual dysfunction (FSD), clitoral dysfunction, female hypoactive sexual desire disorder, female sexual arousal disorder, female sexual pain disorder or female sexual orgasmic dysfunction (FSOD) as well as sexual dysfunction due to spinal cord injury or selective serotonin re-uptake inhibitor (SSRI) induced sexual dysfunction but, clearly, will be useful also for treating other medical conditions for which a potent and selective cGMP PDE5 inhibitor is indicated. Such conditions include premature labour, dysmenorrhoea, benign prostatic hyperplasia (BPH), bladder outlet obstruction, incontinence, stable, unstable and variant (Prinzmetal) angina, hypertension, pulmonary hypertension, chronic obstructive pulmonary disease, coronary artery disease, congestive heart failure, atherosclerosis, conditions of reduced blood vessel patency, e.g. post-percutaneous transluminal coronary angioplasty (post-PTCA), peripheral vascular disease, stroke, nitrate induced tolerance, bronchitis, allergic asthma, chronic asthma, allergic rhinitis, diseases and conditions of the eye such as glaucoma, optic neuropathy, macular degeneration, elevated intra-ocular pressure, retinal or arterial occlusion and diseases characterised by disorders of gut motility, e.g. irritable bowel syndrome (IBS).

Further medical conditions for which a potent and selective cGMP PDE5 inhibitor is indicated, and for which treatment with compounds of the present invention may be useful, include pre-eclampsia, Kawasaki's syndrome, nitrate tolerance, multiple sclerosis, diabetic nephropathy, neuropathy including autonomic and peripheral neuropathy and in particular diabetic neuropathy and symptoms thereof (e.g. gastroparesis), peripheral diabetic neuropathy, Alzheimer's disease, acute respiratory failure, psoriasis, skin necrosis, cancer, metastasis, baldness, nutcracker oesophagus, anal fissure, haemorrhoids, hypoxic vasoconstriction, , hypoxic vasoconstriction, diabetes, type 2 diabetes mellitus, the insulin resistance syndrome, insulin resistance, impaired glucose tolerance, as well as the stabilisation of blood pressure during haemodialysis.

Particularly preferred sexual disorders include MED and FSD.

An individual enantiomer of a compound of formula I may also be prepared from a corresponding optically pure intermediate or by resolution, such as by H.P.L.C. of the corresponding racemate using a suitable chiral support or by fractional crystallisation of the diastereoisomeric salts formed by reaction of the corresponding racemate with a suitable optically active acid or base, as appropriate.

All stereoisomers are included within the scope of the invention.

## Preparation

According to a further aspect of the invention there is provided processes for the preparation of compounds of the invention, as illustrated below.

The following processes are illustrative of the general synthetic procedures which may be adopted in order to obtain the compounds of the invention:

1. Compounds of formulae IA, IC, ID and IE may be prepared by cyclisation of corresponding compounds of formulae IIA, IIC, IID and IIE, respectively:

wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $R^5$  and  $X$  are as defined previously for compounds of formulae IA, IC, ID and IE.

This cyclisation may be accomplished under basic, neutral or acidic conditions using known methods for pyrimidone ring formation. Preferably, the cyclisation is performed under basic conditions using an alkali metal salt of an alcohol or amine, such as sodium ethoxide, potassium *tert*-butoxide, cesium carbonate or potassium bis(trimethylsilyl)amide, in the presence of a suitable alcohol as solvent, for example at reflux temperature (or, if performed in a

sealed vessel, at greater than reflux temperature). The skilled person will appreciate that, when an alcohol is selected as solvent, an appropriate alcohol of formula  $R^4OH$  may be used if it is intended to mitigate alkoxide exchange at the 2-position of either the pyridin-3-yl or phenyl substituent. Conversely, a sterically hindered alcohol (e.g. 3-methyl-3-pentanol) may be used to avoid exchange at the 2-position of either the pyridin-3-yl or phenyl substituent. Optionally, an equivalent of an additive (e.g.  $R^4OAc$ ) may be added to act as a hydroxide scavenger.

Compounds of formulae IIA, IIC, IID and IIE may be prepared by reaction of corresponding compounds of formulae IIIA, IIIC, IIID and IIIE, respectively:

wherein  $R^1$ ,  $R^2$  and  $R^3$  are as defined previously for compounds of formulae IIA, IIC, IID and IIE, with a compound of formula IV or a carboxylic acid derivative thereof:

wherein  $R^4$ ,  $R^5$  and X are as defined previously for compounds of formulae IIA, IIC, IID and IIE.

This coupling reaction may be achieved by conventional amide bond forming techniques which are well known to those skilled in the art. For example, an acyl halide (e.g. chloride) derivative of a compound of formula IV may be reacted with a compound of formula IIIA, IIIC, IIID or IIIE in the presence of an excess of a tertiary amine, such as triethylamine or pyridine, optionally in the presence of a suitable catalyst, such as 4-dimethylaminopyridine, in a suitable solvent such as dichloromethane or THF, at a temperature of about 0°C to room temperature.

A variety of other amino acid coupling methodologies may be used to couple the compounds of formulae IIIA, IIIC, IIID or IIIE with the compound of formula IV. For example, the acid of formula IV or a suitable salt thereof (e.g. sodium salt) may be activated with an appropriate activating reagent, e.g. a carbodiimide, such as 1,3-dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride optionally in the presence of 1-hydroxybenzotriazole hydrate and/or a catalyst such as 4-dimethylaminopyridine; a halotrisaminophosphonium salt such as bromotris(pyrrolidinyl)phosphonium hexafluorophosphate; a suitable pyridinium salt such as 2-chloro-1-methyl pyridinium chloride; or another suitable coupling agent such as O-(7-azabenzotriazol-1-yl)-*N,N,N',N'*-tetramethyl-uronium hexafluorophosphate (HATU). Either type of coupling reaction may be conducted in a suitable solvent such as dichloromethane, tetrahydrofuran or *N,N*-dimethylformamide, optionally in the presence of a tertiary amine such as *N*-methylmorpholine or *N*-ethyldiisopropylamine (for example when either the compound of formula IIIA, IIIC, IIID or IIIE, or the activating agent is presented in the form of an acid addition salt), at from about 0°C to about room temperature. Preferably, from about 1 to 2 molecular equivalents of the activating reagent and from 1 to 3 molecular equivalents of any tertiary amine present may be employed.

Alternatively, the carboxylic acid function of IV may be activated using an excess of a reagent such as *N,N'*-carbonyldiimidazole in an appropriate solvent, e.g. ethyl acetate, dichloromethane or butan-2-one, at from about

room temperature to about 80°C, followed by reaction of the intermediate imidazolid with either a compound of the formula IIIA, IIIC, IIID or IIIE at from about 20°C to about 90°C.

In a further variation, a compound of formula IA, IC, ID or IE, as defined previously, may be formed in a one-pot procedure by coupling a compound of formula IIIA, IIIC, IIID or IIIE with the acyl chloride or a lower alkyl ester derivative of formula IV and by cyclising the resultant intermediate compound of formula IIA, IIC, IID or IIE, using the methods as described previously. When using an acyl chloride derivative of formula IV, a suitable solvent (e.g. pyridine) may serve as both an acid scavenger and as the solvent for the *in-situ* coupling and cyclisation reaction.

Compounds of formula IV, where X is CH and R<sup>5</sup> is Me, may be prepared from compounds of formula V:

wherein R<sup>4</sup> is as defined previously for compounds of formula IV, and R<sup>P</sup> is a protecting group for a carboxylic acid (preferably a lower alkyl group such as methyl, ethyl or t-butyl), by using standard methods for deprotection.

Compounds of formula VIII may be prepared from compounds of formula IX by first forming an intermediate diazonium salt, for example by the action of sodium nitrite in a mixture of concentrated hydrochloric acid and glacial acetic acid at from about  $-25^\circ\text{C}$  to about  $0^\circ\text{C}$ , followed by reaction with  $R^5\text{SSR}^5$  and a copper salt, preferably  $\text{CuBr}_2$ , for example at between  $0^\circ\text{C}$  and room temperature:

wherein  $R^4$ ,  $R^5$  and X are as defined previously for compounds of formula VIII.

wherein  $R^4$  and X are as defined previously for compounds of formula IX, for example with hydrogen at 60 psi in a suitable solvent (e.g.  $R^4OH$ ) at between room temperature and 60°C in the presence of an appropriate catalyst (e.g. 10% palladium on carbon).

Alternatively, compounds of formula VIII may be prepared from compounds of formula XI:

wherein  $R^4$ ,  $R^5$  and X are as defined previously for compounds of formula VIII, and  $R^P$  is a protecting group for a carboxylic acid (preferably a lower alkyl group such as methyl, ethyl or t-butyl), by using standard methods for deprotection.

wherein  $R^4$ , X and  $R^P$  are as defined previously for compounds of formula XI, by reaction with thiourea (1.1 equivalents) and a nickel (0) catalyst, generated *in situ* from bis(triethylphosphine)nickel(II) chloride (0.05 equivalents) and sodium cyanoborohydride (0.075 equivalents), in a suitable solvent (e.g. *N,N*-

Compounds of formulae IIIA, IIIC, IIID, IIIE, VII, X, XII (where X represents CH), XIII, XV, XXIA, XXIC, XXID, XXIE, XXIVE, XXVE, XXVIE, XXXIB, XXXIIB and XXXVB and derivatives thereof, when not commercially available or not subsequently described, may be obtained either by analogy with the processes described hereinbefore, or by conventional synthetic procedures, in accordance with standard techniques, from readily available starting materials using appropriate reagents and reaction conditions. For example, compounds of formula XXIVE may be prepared by, or by analogy with, methods described in US4039544.

Substituents on the aryl and Het groups in the above-mentioned compounds may be introduced, and interconverted, using techniques which are known to those skilled in the art.

Further standard substituent or functional group interconversions and transformations that may be performed on compounds of formulae I, IA, IB, IC, ID, IE and their precursors include procedures described hereinafter. In this respect:

- (i) alkoxy carbonyl may be hydrolysed to carboxy under acidic or basic conditions;
- (ii) amino may be alkylated (either by reaction with an alkylating agent or by reductive alkylation) to give alkylamino or dialkylamino;
- (iii) amino may be acylated to give acylamino or sulfonated to give sulfonylamino.

In addition, certain acyclic groups may be converted to certain heterocyclic groups using reagents and conditions known to those skilled in the art, for example as described in Comprehensive Heterocyclic Chemistry II, edited by AR Katritzky, CW Rees and EFV Scriven, 1<sup>st</sup> Edition, Elsevier Science Ltd., Volumes 1-11 (1996).

The compounds of the invention may be isolated from their reaction mixtures using conventional techniques.

It will be appreciated by those skilled in the art that, in the course of carrying out the above processes described above, the functional groups of intermediate compounds may need to be protected by protecting groups.

Functional groups which it is desirable to protect include hydroxy, amino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl and diarylalkylsilyl groups (e.g. *tert*-butyldimethylsilyl, *tert*-butyldiphenylsilyl or trimethylsilyl), alkyl (e.g. methyl or methoxyethyl) and tetrahydropyranyl. Suitable protecting groups for amino include *tert*-butyloxycarbonyl, 9-fluorenylmethoxycarbonyl or benzyloxycarbonyl. Suitable protecting groups for carboxylic acid include C<sub>1-6</sub> alkyl or benzyl esters.

The protection and deprotection of functional groups may take place before or after any of the reaction steps described hereinbefore.

Protecting groups may be removed in accordance with techniques which are known to those skilled in the art.

The use of protecting groups is fully described in "Protective Groups in Organic Chemistry", edited by JWF McOmie, Plenum Press (1973), "Protective Groups in Organic Synthesis", 2<sup>nd</sup> edition, TW Greene & PGM Wutz, Wiley-Interscience (1991) and "Protecting Groups" by Philip J. Kocienski, Thieme, 1994.

Persons skilled in the art will also appreciate that, in order to obtain compounds of formulae I, IA, IB, IC, ID and IE, in an alternative, and, on some occasions, more convenient, manner, the individual process steps mentioned hereinbefore may be performed in a different order, and/or the individual reactions may be performed at a different stage in the overall route (i.e. substituents may be added to and/or chemical transformations performed upon, different intermediates to those mentioned hereinbefore in conjunction with a particular reaction). This will depend *inter alia* on factors such as the nature of other functional groups present in a particular substrate, the availability of key intermediates and the protecting group strategy (if any) to be adopted. Clearly, the type of chemistry involved will influence the choice of reagent that is used in the said synthetic steps, the need, and type, of protecting groups that are employed, and the sequence for accomplishing the synthesis.

Pharmaceutically acceptable acid addition salts of the compounds of formulae I, IA, IB, IC, ID and IE which contain a basic centre may be prepared in a conventional manner. For example, a solution of the free base may be treated with the appropriate acid, either neat or in a suitable solvent, and the resulting salt may then be isolated either by filtration or by evaporation under vacuum of the reaction solvent. Pharmaceutically acceptable base addition salts can be obtained in an analogous manner by treating a solution of a compound of formulae I, IA, IB, IC, ID and IE with the appropriate base. Both types of salt may be formed or interconverted using ion-exchange resin techniques.

The present invention also includes all suitable isotopic variations of a compound of formulae I, IA, IB, IC, ID or IE or a pharmaceutically acceptable salt thereof. An isotopic variation of a compound of formulae I, IA, IB, IC, ID or IE, or a pharmaceutically acceptable salt thereof is defined as one in which at least one atom is replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Examples of isotopes that can be incorporated into compounds of formulae I, IA, IB, IC, ID or IE, and pharmaceutically acceptable salts thereof include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine and chlorine such as  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{15}\text{N}$ ,  $^{17}\text{O}$ ,  $^{18}\text{O}$ ,  $^{31}\text{P}$ ,  $^{32}\text{P}$ ,  $^{35}\text{S}$ ,  $^{18}\text{F}$  and  $^{36}\text{Cl}$ , respectively. Certain isotopic variations of the compounds of formulae I, IA, IB, IC, ID or IE, and pharmaceutically acceptable salts thereof, for example, those in which a radioactive isotope such as  $^3\text{H}$  or  $^{14}\text{C}$  is incorporated, are useful in drug and/or substrate tissue distribution studies. Tritiated, i.e.,  $^3\text{H}$ , and carbon-14, i.e.,  $^{14}\text{C}$ , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with isotopes such as deuterium, i.e.,  $^2\text{H}$ , may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements and hence may be preferred in some circumstances. Isotopic variations of the compounds of formulae I, IA, IB, IC, ID or IE, and pharmaceutically acceptable salts thereof of this invention can generally be prepared by conventional procedures such as by the illustrative methods or by the preparations described in the Examples and Preparations hereafter using appropriate isotopic variations of suitable reagents.

It will be appreciated by those skilled in the art that certain protected derivatives of compounds of formulae I, IA, IB, IC, ID and IE, which may be made prior to a final deprotection stage, may not possess pharmacological activity as such, but may, in certain instances, be administered orally or parenterally and thereafter metabolised in the body to form compounds of the invention which are pharmacologically active. Such derivatives may therefore be described as "prodrugs". Further, certain compounds of formulae I, IA, IB, IC, ID and IE may

act as prodrugs of other compounds of formulae I, IA, IB, IC, ID and IE respectively.

All protected derivatives, and prodrugs, of compounds of formulae I, IA, IB, IC, ID and IE are included within the scope of the invention.

The present invention additionally comprises the combination of a cGMP PDE<sub>5</sub> inhibitor compound of the general formulae I, IA, IB, IC, ID or IE, wherein said combination can be administered by sequential, simultaneous or joint administration of a compound of the general formulae I, IA, IB, IC, ID or IE, with:

### **Medical Use**

The compounds of the invention are useful because they possess pharmacological activity in animals, especially mammals, including humans. They are therefore indicated as pharmaceuticals, as well as for use as animal medicaments.

In particular, compounds of the invention have been found to be potent and selective inhibitors of cGMP PDE5, for example as demonstrated in the tests described below, and are thus useful in the treatment of medical conditions in humans and other animals, in which cGMP PDE5 is indicated, and in which inhibition of cGMP PDE5 is desirable.

By the term "treatment", we include both therapeutic (curative), palliative or prophylactic treatment.

Thus, according to a further aspect of the invention there is provided the use of the compounds of the invention in the manufacture of a medicament for the treatment of a medical condition in which cGMP PDE5 is indicated. There is further provided the use of the compounds of the invention in the manufacture of a medicament for the treatment of a medical condition in which inhibition of cGMP PDE5 is desirable.

The compounds of the invention are expected to be useful for the curative, palliative or prophylactic treatment of mammalian sexual disorders or any of the other conditions or disorders detailed hereinbefore. In particular, the

For example, the compounds of the invention or salts or solvates thereof can be administered orally, buccally or sublingually in the form of tablets, capsules (including soft gel capsules), ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, controlled-release such as modified-, dual-, sustained-, or pulsatile delivery applications. The compounds of the invention may also be administered via intracavernosal injection. The compounds of the invention may also be administered via fast dispersing or fast dissolving dosages forms.

Such tablets may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato or tapioca starch), disintegrants such as sodium starch glycolate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethyl cellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

Solid compositions of a similar type may also be employed as fillers in gelatin capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the invention may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and glycerin, and combinations thereof.

Modified release and pulsatile release dosage forms may contain excipients such as those detailed for immediate release dosage forms together with additional excipients that act as release rate modifiers, these being coated on and/or included in the body of the device. Release rate modifiers include, but are not exclusively limited to, hydroxypropylmethyl cellulose, methyl cellulose, sodium carboxymethylcellulose, ethyl cellulose, cellulose acetate, polyethylene oxide, Xanthan gum, Carbomer, ammonio methacrylate copolymer, hydrogenated castor oil, carnauba wax, paraffin wax, cellulose acetate phthalate, hydroxypropylmethyl cellulose phthalate, methacrylic acid copolymer and mixtures thereof. Modified release and pulsatile release dosage forms may contain one or a combination of release rate modifying excipients. Release rate modifying excipients may be present both within the dosage form i.e. within the matrix, and/or on the dosage form i.e. upon the surface or coating.

Fast dispersing or dissolving dosage formulations (FDDFs) may contain the following ingredients: aspartame, acesulfame potassium, citric acid, croscarmellose sodium, crospovidone, diascorbic acid, ethyl acrylate, ethyl cellulose, gelatin, hydroxypropylmethyl cellulose, magnesium stearate, mannitol, methyl methacrylate, mint flavouring, polyethylene glycol, fumed silica, silicon dioxide, sodium starch glycolate, sodium stearyl fumarate, sorbitol, xylitol. The terms dispersing or dissolving as used herein to describe FDDFs are dependent upon the solubility of the drug substance used i.e. where the drug substance is insoluble a fast dispersing dosage form can be prepared and where the drug substance is soluble a fast dissolving dosage form can be prepared.

The compounds of the invention can also be administered parenterally, for example, intracavernosally, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion techniques. For such parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

For oral and parenteral administration to human patients, the daily dosage level of the compounds of the invention or salts or solvates thereof will usually be from 10 to 500 mg (in single or divided doses).

Thus, for example, tablets or capsules of the compounds of the invention or salts or solvates thereof may contain from 5mg to 250 mg of active compound for administration singly or two or more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the

average case. There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within the scope of this invention. The skilled person will also appreciate that, in the treatment of certain conditions (including MED and FSD), compounds of the invention may be taken as a single dose on an "as required" basis (i.e. as needed or desired).

#### Example Tablet Formulation

In general a tablet formulation could typically contain between about 0.01mg and 500mg of a compound according to the present invention (or a salt thereof) whilst tablet fill weights may range from 50mg to 1000mg. An example formulation for a 10mg tablet is illustrated:

<u>Ingredient</u>	<u>%w/w</u>
Compound of Example 19	10.000*
Lactose	64.125
Starch	21.375
Croscarmellose Sodium	3.000
Magnesium Stearate	1.500

\* This quantity is typically adjusted in accordance with drug activity.

Such tablets can be manufactured by standard processes, for example, direct compression or a wet or dry granulation process. The tablet cores may be coated with appropriate overcoats.

The compounds of the invention can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray or nebuliser with the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark] or 1,1,1,2,3,3,3-

heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide or other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray or nebuliser may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the invention and a suitable powder base such as lactose or starch.

Aerosol or dry powder formulations are preferably arranged so that each metered dose or "puff" contains from 1 to 50 mg of a compound of the invention for delivery to the patient. The overall daily dose with an aerosol will be in the range of from 1 to 50 mg which may be administered in a single dose or, more usually, in divided doses throughout the day.

The compounds of the invention may also be formulated for delivery via an atomiser. Formulations for atomiser devices may contain the following ingredients as solubilisers, emulsifiers or suspending agents: water, ethanol, glycerol, propylene glycol, low molecular weight polyethylene glycols, sodium chloride, fluorocarbons, polyethylene glycol ethers, sorbitan trioleate, oleic acid.

Alternatively, the compounds of the invention or salts or solvates thereof can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The compounds of the invention or salts or solvates thereof may also be dermally administered. The compounds of the invention or salts or solvates thereof may also be transdermally administered, for example, by the use of a skin patch. They may also be administered by the ocular, pulmonary or rectal routes.

For ophthalmic use, the compounds can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

For application topically to the skin, the compounds of the invention or salts or solvates thereof can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

The compounds of the invention may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility, dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

Generally, in humans, oral administration of the compounds of the invention is the preferred route, being the most convenient and, for example in MED, avoiding the well-known disadvantages associated with intracavernosal (i.c.) administration. A preferred oral dosing regimen in MED for a typical man is from 25 to 250 mg of compound when required. In circumstances where the recipient suffers from a swallowing disorder or from impairment of drug

absorption after oral administration, the drug may be administered parenterally, sublingually or buccally.

For veterinary use, a compound of the invention, or a veterinarily acceptable salt thereof, or a veterinarily acceptable solvate or pro-drug thereof, is administered as a suitably acceptable formulation in accordance with normal veterinary practice and the veterinary surgeon will determine the dosing regimen and route of administration which will be most appropriate for a particular animal.

Thus, according to a further aspect of the invention there is provided a pharmaceutical formulation including a compound of the invention in admixture with a pharmaceutically or veterinarily acceptable adjuvant, diluent or carrier.

In addition to the fact that compounds of the invention inhibit cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDEs) and in particular, are potent and selective inhibitors of cGMP PDE5, compounds of the invention may also have the advantage that they may be more efficacious than, be less toxic than, have a broader range of activity than, be more potent than, produce fewer side effects than, be more easily absorbed than, or they may have other useful pharmacological properties over, compounds known in the prior art.

#### BIOAVAILABILITY

Preferably the compounds of the invention are orally bioavailable. Oral bioavailability refers to the proportion of an orally administered drug that reaches the systemic circulation. The factors that determine oral bioavailability of a drug are dissolution, membrane permeability and metabolic stability. Typically, a screening cascade of firstly *in vitro* and then *in vivo* techniques is used to determine oral bioavailability.

Dissolution, the solubilisation of the drug by the aqueous contents of the gastro-intestinal tract (GIT), can be predicted from *in vitro* solubility experiments conducted at appropriate pH to mimic the GIT. Preferably the compounds of the invention have a minimum solubility of 50 mcg/ml. Solubility can be determined by standard procedures known in the art such as described in Adv. Drug Deliv. Rev. 23, 3-25, 1997.

Membrane permeability refers to the passage of the compound through the cells of the GIT. Lipophilicity is a key property in predicting this and is defined by *in vitro* Log  $D_{7.4}$  measurements using organic solvents and buffer. Preferably the compounds of the invention have a Log  $D_{7.4}$  of -2 to +4, more preferably -1 to +2. The log D can be determined by standard procedures known in the art such as described in J. Pharm. Pharmacol. 1990, 42:144.

Cell monolayer assays such as caco-2 add substantially to prediction of favourable membrane permeability in the presence of efflux transporters such as p-glycoprotein, so-called caco-2 flux. Preferably, compounds of the invention have a caco-2 flux of greater than  $2 \times 10^{-6} \text{cms}^{-1}$ , more preferably greater than  $5 \times 10^{-6} \text{cms}^{-1}$ . The caco flux value can be determined by standard procedures known in the art such as described in J. Pharm. Sci, 1990, 79, 595-600

Metabolic stability addresses the ability of the GIT or the liver to metabolise compounds during the absorption process: the first pass effect. Assay systems such as microsomes, hepatocytes etc are predictive of metabolic liability. Preferably the compounds of the Examples show metabolic stability in the assay system that is commensurate with an hepatic extraction of less than 0.5. Examples of assay systems and data manipulation are described in Curr. Opin. Drug Disc. Devel., 201, 4, 36-44, Drug Met. Disp., 2000, 28, 1518-1523

Because of the interplay of the above processes further support that a drug will be orally bioavailable in humans can be gained by *in vivo* experiments in animals. Absolute bioavailability is determined in these studies by administering the compound separately or in mixtures by the oral route. For

absolute determinations (% absorbed) the intravenous route is also employed. Examples of the assessment of oral bioavailability in animals can be found in Drug Met. Disp., 2001, 29, 82-87; J. Med Chem , 1997, 40, 827-829, Drug Met. Disp., 1999, 27, 221-226

The biological activities of the compounds of the present invention were determined by the following test methods.

*Phosphodiesterase (PDE) inhibitory activity*

The compounds of the present invention are potent and selective cGMP PDE5 inhibitors. *In vitro* PDE inhibitory activities against cyclic guanosine 3',5'-monophosphate (cGMP) and cyclic adenosine 3',5'-monophosphate (cAMP) phosphodiesterases were determined by measurement of their IC<sub>50</sub> values (the concentration of compound required for 50% inhibition of enzyme activity).

The required PDE enzymes were isolated from a variety of sources, including human corpus cavernosum, human platelets, human cardiac ventricle, human skeletal muscle and human and canine retina, essentially by the method of W.J. Thompson and M.M. Appleman (Biochem., 1971, 10, 311). In particular, the cGMP-specific PDE (PDE5) and the cGMP-inhibited cAMP PDE (PDE3) were obtained from human corpus cavernosum tissue or human platelets; the cGMP-stimulated PDE (PDE2) was obtained from human corpus cavernosum or human platelets; the calcium/calmodulin (Ca/CAM)-dependent PDE (PDE1) from human cardiac ventricle; the cAMP-specific PDE (PDE4) from recombinant clone or human skeletal muscle; and the photoreceptor PDE (PDE6) from canine or human retina. Phosphodiesterases 7-11 were generated from full length human recombinant clones transfected into SF9 cells.

Assays were performed either using a modification of the "batch" method of W.J. Thompson et al. (Biochem., 1979, 18, 5228) or using a scintillation

proximity assay for the direct detection of AMP/GMP using a modification of the protocol described by Amersham plc under product code TRKQ7090/7100. In summary, the effect of PDE inhibitors was investigated by assaying a fixed amount of enzyme in the presence of varying inhibitor concentrations and low substrate, (cGMP or cAMP in a 3:1 ratio unlabelled to [ $^3\text{H}$ ]-labelled at a conc  $\sim 1/2 K_m$ ) such that  $\text{IC}_{50} \cong K_i$ . The final assay volume was made up to 102  $\mu\text{l}$  with assay buffer [20 mM Tris-HCl pH 7.4, 5 mM  $\text{MgCl}_2$ , 1 mg/ml bovine serum albumin]. Reactions were initiated with enzyme, incubated for 30-60 min at 30°C to give <30% substrate turnover and terminated with 50  $\mu\text{l}$  yttrium silicate SPA beads (containing 3 mM of the respective unlabelled cyclic nucleotide for PDEs 3, 9 and 11). Plates were resealed and shaken for 20 min, after which the beads were allowed to settle for 30 min in the dark and then counted on a TopCount plate reader (Packard, Meriden, CT). Radioactivity units were converted to % activity of an uninhibited control (100%), plotted against inhibitor concentration and inhibitor  $\text{IC}_{50}$  values obtained using the 'Fit Curve' Microsoft Excel extension or in-house equivalent. Results from these tests show that the compounds of the present invention are potent and selective inhibitors of cGMP-specific PDE5.

#### *Functional activity*

This can be assessed *in vitro* by determining the capacity of a compound of the invention to enhance sodium nitroprusside-induced relaxation of pre-contracted rabbit corpus cavernosum tissue strips, as described by S.A. Ballard *et al.* (Brit. J. Pharmacol., 1996, 118 (suppl.), abstract 153P).

#### *In vivo activity*

This can be assessed by screening the compounds of the invention in anaesthetised dogs to determine their capacity, after i.v. administration, to enhance the pressure rises in the corpora cavernosa of the penis induced by intracavernosal injection of sodium nitroprusside, using a method based on that described by Trigo-Rocha *et al.* (Neurourol. and Urodyn., 1994, 13, 71).

### *Safety Profile*

Compounds of the invention can be tested at varying i.v and p.o. doses in animals such as mouse and dog, observing for any untoward effects.

### *In vitro metabolism*

*In vitro* metabolism experiments were carried out in the hepatic microsomal fractions from man. Transplant-quality human liver tissue was obtained from the International Institute for the Advancement of Medicine (Exton, PA, USA). Microsomes were prepared according to the method described in *Biochemical Pharmacology*, **1966**, 48, 2147-2156 and stored at -80°C. The concentrations of protein and cytochrome P450 were determined by standard methods described in *Journal of Biological Chemistry*, **1951**, 193, 265-275 and *Journal of Biological Chemistry*, **1964**, 239, 2370-2378.

Microsomal incubations (1.5 ml) were prepared containing 0.5 µM cytochrome P450, 200 mM phosphate buffer (pH 7.4), 0.1 M MgCl<sub>2</sub>, 0.1 M isocitric acid, 1 unit/ml isocitrate dehydrogenase and 20 mM β-NADP. Compounds under study were added after a 5 min preincubation at 37°C to give an initial substrate concentration of 1 µM. The mixture was incubated at 37°C and samples (100 µl) were removed for analysis for up to 60 min. Metabolism in samples was terminated by the addition of NaOH (0.1 M) containing an internal standard (chosen to have similar physicochemical properties to compounds under study), followed by extraction into ethyl acetate (2 ml). The extracts were evaporated to dryness and analysed by LC-MS/MS (Hewlett Packard HP1100 binary pump, Hypersil HS100 C18, 5 cm by 4.6 mm internal diameter, 5 µm column using a mobile phase of 2mM ammonium acetate in 90:10 methanol/water, aqueous portion adjusted to pH 4 with glacial acetic acid, and a flowrate of 1 ml/min). The mass spectrometer was a Sciex API 2000 with TurbolonSpray interface using a positive ion multiple reaction monitoring (MRM) detection mode. Nitrogen was used as curtain, nebuliser,

TurbolonSpray and collision gases, and the TurbolonSpray temperature was 100°C. Typical voltages were as follows: IS = 5.2 kV; RNG = 380 V; Q0 = -10 V; IQ1 = -11 V; ST = -15; RO1 = -11 V; MU = gain adjusted as per Sciex user manual. Collision energy was 55 eV for high MRM, OR = 65 V. Dwell time was 200 msec with a 50 msec pause. Data was acquired using MSExpress v 1.1 and processed using Macquan 1.5 (PE Sciex)). Disappearance rate constants ( $k$ ) in human microsomal preparations were determined by linear regression of the log ratio (compound under study/internal standard) versus time. The *in vitro* human microsomal half-lives were determined according to the equation  $t_{1/2} = \ln 2/k$ . Results from these studies show that the compounds of the present invention have human liver microsome (HLM) half-lives greater than the HLM half-lives of known compounds of the art.

Thus a particular advantage of the compounds of the invention is that they have longer *in vitro* microsomal half-lives than compounds of the art. Such improved *in vitro* microsomal half-lives are indicative of reduced clearance *in vivo*.

Preferred compounds of the present invention, such as those of Examples 1 – 22, 24-26 and 28-29 have IC<sub>50</sub> values of less than about 30nM for the PDE5 enzyme. More preferred compounds, such as those of Examples 1 - 3, 5 ,7 – 19, 24-25 and 28-29 have IC<sub>50</sub> values of less than about 10nM for the PDE5 enzyme.

Especially preferred herein are compounds which have an IC<sub>50</sub> value of less than about 30 nM, and more preferably less than 10 nM for the PDE5 enzyme and especially less than 5 nM for the PDE5 enzyme in combination with selectivity of greater than 10-fold, more preferably greater than 50-fold, more preferably greater than 100-fold and most preferably greater than 200-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme.

An especially preferred subset of the compounds described in the previous paragraph are compounds with human liver microsome (HLM) half-lives greater than about 30 minutes, more preferably greater than 60 minutes, and

most preferably greater than 120 minutes – when measured according to the methods detailed hereinbefore. Preferred compounds herein having HLM half-lives greater than or equal to about 30 minutes include the compounds of examples 1, 2, 9, 11, 12, 14, 18 and 19.

Those skilled in the art will recognise that an increase in HLM half-life is predictive of reduced clearance in man for compounds cleared predominantly by cytochrome P450 mediated metabolism.

### **Examples and Preparations**

The synthesis of the compounds of the invention and of the intermediates for use therein are illustrated by the following Examples and Preparations.

<sup>1</sup>H nuclear magnetic resonance (NMR) spectra were recorded using either a Varian Unity 300 or a Varian Inova 400 spectrometer and were in all cases consistent with the proposed structures. Characteristic chemical shifts ( $\delta$ ) are given in parts-per-million downfield from tetramethylsilane using conventional abbreviations for designation of major peaks: e.g. s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad.

Mass spectra (m/z) were recorded using a Fisons Instruments Trio mass spectrometer in the thermospray ionisation mode (TSP) or using a Finnigan navigator in electrospray ionisation mode (ES) - positive and/or negative ionisation mode.

Optical rotations were measured on a Perkin Elmer 341 polarimeter.

As used herein, the term "column chromatography" refers to normal phase chromatography using silica gel (0.04-0.06 mm).

Preparation 301-(Cyclopropylmethyl)-3-ethyl-4-nitro-1H-pyrazole-5-carboxamide

and

Preparation 311-(Cyclopropylmethyl)-5-ethyl-4-nitro-1H-pyrazole-3-carboxamide

A suspension of 3-ethyl-4-nitro-1H-pyrazole-5-carboxamide (40.0 g, 217 mmol, prepared using procedure in WO9849166) in dry DMF (300 ml) was

treated with cesium carbonate (77.8 g, 239 mmol). To this, in a single portion, was added cyclopropylmethyl bromide (32.2 g, 239 mmol) and the resultant suspension stirred at 20°C for 6 h. After concentrating *in vacuo*, the residue was partitioned between EtOAc (200 ml) and water (200 ml), and the insoluble material removed by filtration. The solid was partitioned between water (200 ml) and DCM (200 ml), and undissolved solid removed by filtration. Combined organics were washed with brine (100 ml), dried (MgSO<sub>4</sub>), filtered and concentrated *in vacuo* to a solid (~40 g). The two regioisomers were separated by crystallisation of the crude mixture. The more lipophilic component (R<sub>f</sub> = 0.27, DCM:MeOH 98:2) crystallised from a mixture of DCM (50 ml) and diisopropylether (200 ml) to give 1-(cyclopropylmethyl)-3-ethyl-4-nitro-1*H*-pyrazole-5-carboxamide (11.9 g, 50.0 mmol, 23%). Crystallisation of the mother liquors from MeCN gave the more polar component (R<sub>f</sub> = 0.19, DCM:MeOH 98:2) (10.0 g, 42.0 mmol) which was confirmed as 1-(cyclopropylmethyl)-5-ethyl-4-nitro-1*H*-pyrazole-3-carboxamide by nOe studies. The mother liquors contained further material as a mixture of regioisomers (20.0 g, 84.0 mmol).

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 18 and 19 are directed to a method of treatment of the human or animal body, the search has been carried out and based on the alleged effects of the compound class.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
